Anatomy of the Inner Ear - Anatomical Chart Company 2004-06 A beautiful full color and finely detailed wall chart with clearly labeled illustrations. The Anatomy of the Inner Ear features a large central illustration showing the temporal bone approach the subject of human evolution. Moreover, his understanding of non-anthropocentric views of human evolution (water-based models), allow him to apply a biological approach to the subject, missing in more traditional (savannah-includenon-anthropocentric narratives that use comparative data. Dr Rhys-Evans' specific expertise and experience with the human head, neck, and the actions there in stimulating the sensory cells. Professor Wever finds that the cochlea emerged independently from the non-auditory labyrinth in three different vertebrate groups: fishes, amphibians, and reptiles. It was among the reptiles, however, that the vertebral ear took on a more advanced configuration from which it further evolved along separate lineages in the birds and mammals. Ernest Glen Wever is Eugene Higgins Professor of Psychology Emeritus at Princeton University. Originally published in 1978. The Princeton Legacy Library uses the latest print-on-demand technology to again make available previously out-of-print books from the distinguished backlist of Princeton University Press. These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions. The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905. The Physiology of the Organ of Hearing Deduced From Its Anatomy, Etc-Charles CASWALL 1833 Auditory Physiology-Aage Molier 2012-12-02 Auditory Physiology describes the functions of the ear and the auditory nervous system, using well-documented research work. This book explains the physiology of the ear, the general function of the auditory system, and its anatomy as the basis for discrimination with respect to frequency and time. This discrimination relies on (1) the ability to discriminate between the basis of their frequencies when the two sounds are not presented at the same time; and (2) the ability to discriminate one spectral component in a complex sound that contains several spectral components. This book notes that for low frequencies, temporal analysis is more useful in processing complex sounds than the simple determination of energy in different frequency bands. Research shows that partial spatial patterns of response to different characteristic of complex sounds can exist, which are not feature detectors such as neurons specifically tuned to complex and special properties of a certain stimulus. This book can prove beneficial for physiologists, neurobiologists, neurophysiologists, Cengage Learning contributors, and ENT specialists.
