Clinical Monitoring for Anesthesia & Critical Care-Carol L. Lake 1994 Describes devices and techniques used for monitoring specific mechanical or physiologic parameters. Coupled with the functional approach to monitors is a comprehensive clinical review of the specialized monitoring used in cardia anesthesia, neuroanesthesia, obstetric anesthesia, and intensive care units. Extensive descriptions of intraoperative transesophageal echocardiography, metabolic monitoring, and central nervous system monitors are prominent features of this book. Demonstrates both how to work and maintain equipment and how to put the results to effective use Describes both invasive and noninvasive monitoring devices as well as automated and nonautomated monitoring devices Reviews the clinical physiology relevant to cardia anesthesia, neuroanesthesia, obstetric anesthesia, and intensive care units that forms the basis for monitoring each chapter.
focuses on operations in which special maneuvers or aspects of technique are important in determining a successful outcome, such as arterial surgery that includes procedures for revascularization of the brain, operations on the larger arteries, and microvascular surgery. The problems associated with aortic surgery and its important branches to the kidneys and visceral are also covered. This text likewise considers surgery to the profunda femoris artery and lower limb revascularization, with some emphasis on bypass techniques of one sort or another. Basic principles of duplex and color Doppler sonography are discussed, and examination techniques clearly explained. The interpretation of findings is elucidated with the assistance of numerous high-quality illustrations. All of these are written by recognized experts in the field. Ideal for all those who are interested in sonography of the venous system.
